---

Gary,

Here's the updated map with the well depth and water level listed by each well. The first number is the water depth and the second number is the water level. Some records were blank or null and those are represented by an "N". I've included both the wells from the groundwater database and the locations from the Submitted Drillers Report database.

Let me know if there are other changes you want.

Jeff

Thanks Jeff. Any info on the depths/zones of these wells would be appreciated. Can we assume that if the wells aren't on the TWDB database, then they aren't drinking water wells?

Thanks,

Attached is a map displaying locations from the Submitted Drillers Reports database. It had 2 tables with locations and I've put both on the map. The first is the main report location which contains the locations of wells drilled. The second table had plugged locations. There isn't a lot of information in these tables. There are a lot of fields but most are blank. I might be able to get well depth, water

9561482

level and some have general descriptions of lithology (red clay, green clay, sand, .....), but not much else.

Gary,

TWDB has another database I just found that is named the "Submitted Driller's Reports". It shows 2 wells within or near the Southern Impoundments.

One of the wells is owned by Glendale Boatworks and is listed as a **replacement** well for industrial use. I assume there has to be another well that isn't listed anywhere for this one to replace. It was drilled in May of 2011.

The other was drilled in 2006 and is owned by Kirby Inland Marine. It is listed as a new well for Public Supply, however it is also listed as "Plans not approved by TCEQ".

There are also other wells in the area that are not in the groundwater database. I've downloaded this database as well and will make a map displaying wells from both databases so you can see all the wells.

Jeff
